

air advice[®]

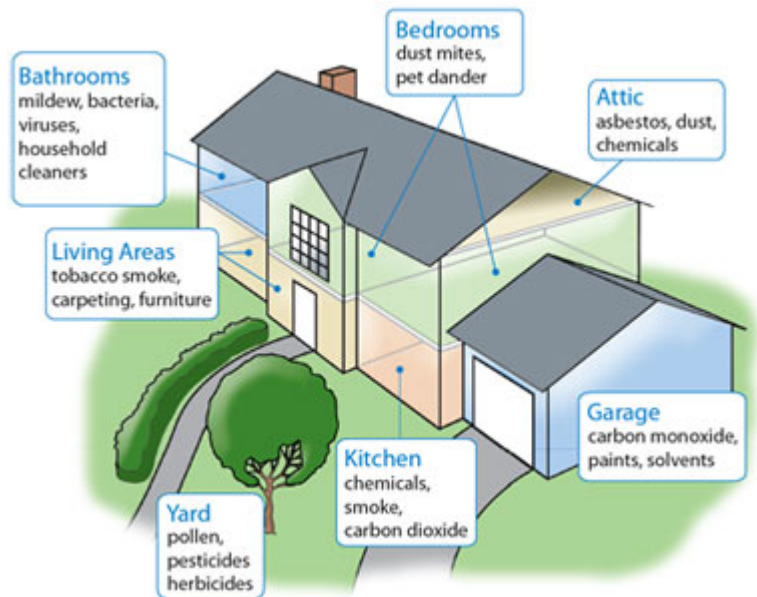

Air Advice develops technologies to monitor and analyze building performance and indoor environment parameters that impact occupants' comfort, health and safety.

We assist contractors, facilities managers and building owners in identifying opportunities for reducing energy costs, improving the operational efficiency of heating, ventilation and air conditioning systems, and solving indoor environmental quality issues.

- A HomeAdvice[™] test locates potential sources of indoor air pollution in your customers' homes.

Most homes have more than one source that contributes to indoor air pollution:

- Building materials and furnishings, such as particle board, flaking asbestos insulation, damp carpet, and upholstery
- Combustible items, such as oil, gas, kerosene, wood, and tobacco
- Household cleaners, paints and solvents, personal care products
- Central heating and cooling systems, and humidifiers
- Pesticides and outdoor air pollution from automobiles and factories
